Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Operation	5
OperationFileParser	7
OperationList	9
RegisterFiles	10

Chapter 2

File Index

2.1 File List

Here is a list of all files with brief descriptions:

Operation.java	13
OperationFileParser.java	13
OperationList.java	13
RegisterFiles.java	13

Chapter 3

Class Documentation

3.1 Operation Class Reference

Public Member Functions

- [Operation](#) (String [opcode](#), String operand_1, String operand_2, String operand_3, String [comment](#))
- [Operation](#) (String [opcode](#), String operand_1, String operand_2, String [comment](#))
- [Operation](#) ([Operation](#) to_copy)
- String [getOpcode](#) ()
- String [getComment](#) ()
- String [getOperand](#) (int number) throws Exception
- int [getNumberOperands](#) ()
- String [getOperands](#) ()
- void [setOpcode](#) (String [opcode](#))
- void [setComment](#) (String [comment](#))
- void [setOperand](#) (int number, String operand_in) throws Exception
- String [toString](#) ()

Private Attributes

- String [opcode](#)
Contains the opcode.
- String [comment](#)
Stores the comment.
- String[] [operands](#)
Stores all operands.

3.1.1 Detailed Description

This class provides all [Operation](#) functionality.

3.1.2 Constructor & Destructor Documentation

3.1.2.1 `Operation.Operation (String opcode, String operand_1, String operand_2, String operand_3, String comment)`

Construct an [Operation](#) object give 1 opcode, 3 operands and one comment.

3.1.2.2 `Operation.Operation (String opcode, String operand_1, String operand_2, String comment)`

Construct an [Operation](#) object give 1 opcode, 2 operands and one comment.

3.1.2.3 `Operation.Operation (Operation to_copy)`

Construct an [Operation](#) object given an existing [Operation](#) object.

3.1.3 Member Function Documentation

3.1.3.1 `String Operation.getComment ()`

Return the comment.

3.1.3.2 `int Operation.getNumberOperands ()`

Return the number of operands

3.1.3.3 `String Operation.getOpcode ()`

Return the opcode -- exempli gratia LOAD, SD, DADDI.

3.1.3.4 `String Operation.getOperand (int number) throws Exception`

Get the operand at the specified position. Positions start at "1". Return an error if the position is invalid.

3.1.3.5 `String Operation.getOperands ()`

Return a String containing all operands.

3.1.3.6 void Operation.setComment (String *comment*)

Set a comment

3.1.3.7 void Operation.setOpcode (String *opcode*)

Set the [Operation](#) opcode.

3.1.3.8 void Operation.setOperand (int *number*, String *operand_in*) throws Exception

Set the operand at the specified position. Positions start at "1". Return an error if the position is invalid.

3.1.3.9 String Operation.toString ()

Return the string representation of the [Operation](#) object.

3.1.4 Member Data Documentation**3.1.4.1 String Operation.comment [private]**

Stores the comment.

3.1.4.2 String Operation.opcode [private]

Contains the opcode.

3.1.4.3 String [] Operation.operands [private]

Stores all operands.

The documentation for this class was generated from the following file:

- [Operation.java](#)

3.2 OperationFileParser Class Reference**Public Member Functions**

- [OperationFileParser](#) ()
- [OperationFileParser](#) (String *filename*)
- void [parseFile](#) ([OperationList](#) *oplist*, [RegisterFiles](#) *reg_files*) throws Exception
- String [toString](#) ()

Private Attributes

- String [filename](#)
The input filename.

3.2.1 Detailed Description

This class provides all file parsing functionality. Given an input file, one [OperationList](#) and one [RegisterFiles](#) will be generated.

3.2.2 Constructor & Destructor Documentation

3.2.2.1 `OperationFileParser.OperationFileParser ()`

Set the input file to the default value of "a.in".

3.2.2.2 `OperationFileParser.OperationFileParser (String filename)`

Set the input file to the specified filename.

3.2.3 Member Function Documentation

3.2.3.1 `void OperationFileParser.parseFile (OperationList oplist, RegisterFiles reg_files)` throws Exception

Parse the input file; generate one [OperationList](#) and one [RegisterFiles](#).

3.2.3.2 `String OperationFileParser.toString ()`

Generates the string representation of the [OperationFileParser](#) Object.

3.2.4 Member Data Documentation

3.2.4.1 `String OperationFileParser.filename` [private]

The input filename.

The documentation for this class was generated from the following file:

- [OperationFileParser.java](#)

3.3 OperationList Class Reference

Public Member Functions

- [OperationList](#) ()
- [OperationList](#) ([OperationList](#) to_copy)
- [ArrayList](#)< [Operation](#) > [getOperationList](#) ()
- [Operation](#) [getOperation](#) (int num) throws Exception
- [Operation](#) [getNextOperation](#) () throws Exception
- boolean [moreOperationsQueued](#) ()
- void [addOperation](#) ([Operation](#) to_add)
- String [toString](#) ()

Private Attributes

- [ArrayList](#)< [Operation](#) > [op_list](#)
The list of Operations.
- int [curr_op](#)
The current Operation.

3.3.1 Detailed Description

This class provides all operation queueing and storage functionality.

3.3.2 Constructor & Destructor Documentation

3.3.2.1 [OperationList](#).[OperationList](#) ()

Initialize the [op_list](#).

3.3.2.2 [OperationList](#).[OperationList](#) ([OperationList](#) to_copy)

Generate a new [OperationList](#) from the specified [OperationList](#).

3.3.3 Member Function Documentation

3.3.3.1 void [OperationList.addOperation](#) ([Operation](#) to_add)

Add an operation to the [OperationList](#)

3.3.3.2 Operation `OperationList.getNextOperation ()` throws Exception

Get the next [Operation](#) to be scheduled.

3.3.3.3 Operation `OperationList.getOperation (int num)` throws Exception

Get an [Operation](#) given a position number. The first position is "1".

3.3.3.4 ArrayList<Operation> `OperationList.getOperationList ()`

Return an `ArrayList<Operation>` that contains a copy of all Operations.

3.3.3.5 boolean `OperationList.moreOperationsQueued ()`

Returns true when there is at least one [Operation](#) that has not been scheduled. Returns false if there is not an [Operation](#) to schedule.

3.3.3.6 String `OperationList.toString ()`

Generates the string representation of the [Operation](#) Object.

3.3.4 Member Data Documentation**3.3.4.1 int** `OperationList.curr_op` [private]

The current [Operation](#).

3.3.4.2 ArrayList<Operation> `OperationList.op_list` [private]

The list of Operations.

The documentation for this class was generated from the following file:

- [OperationList.java](#)

3.4 RegisterFiles Class Reference**Public Member Functions**

- [RegisterFiles](#) ()
- [RegisterFiles](#) ([RegisterFiles](#) to_copy)
- `Hashtable< String, String >` [getIntegerRegisters](#) ()
- `Hashtable< String, String >` [getFPRegisters](#) ()
- `String` [getRegister](#) (String r_id) throws Exception

- void [setRegister](#) (String r_id, String val_in) throws Exception
- String [toString](#) ()

Static Public Attributes

- static final int [NUM_INT_REGISTERS](#) = 32
Total number of integer registers.
- static final int [NUM_FP_REGISTERS](#) = 32
Total number of floating point registers.

Private Attributes

- Hashtable< String, String > [registers_int](#)
Consists of all integer registers.
- Hashtable< String, String > [registers_fp](#)
Consists of all floating point registers.

3.4.1 Detailed Description

This class provides all register functionality for integer and floating point register files.

3.4.2 Constructor & Destructor Documentation

3.4.2.1 RegisterFiles.RegisterFiles ()

Constructs the register files; initializes all floating point and integer registers to "0";

3.4.2.2 RegisterFiles.RegisterFiles (RegisterFiles to_copy)

Generates a copy of an existing [RegisterFiles](#) object.

3.4.3 Member Function Documentation

3.4.3.1 Hashtable<String, String> RegisterFiles.getFPRegisters ()

Returns a Hashtable that contains a copy of the current floating point register file.

3.4.3.2 Hashtable<String, String> RegisterFiles.getIntegerRegisters ()

Returns a Hashtable that contains a copy of the current integer register file.

3.4.3.3 String RegisterFiles.getRegister (String *r_id*) throws Exception

Returns the current value of the specified register. An "Invalid register ID" exception is thrown if the specified register does not exist.

3.4.3.4 void RegisterFiles.setRegister (String *r_id*, String *val_in*) throws Exception

Sets a new value for the specified register. An "Invalid register ID" exception is thrown if the specified register does not exist.

3.4.3.5 String RegisterFiles.toString ()

Generates the string representation of the [RegisterFiles](#) Object.

3.4.4 Member Data Documentation

3.4.4.1 final int RegisterFiles.NUM_FP_REGISTERS = 32 [static]

Total number of floating point registers.

3.4.4.2 final int RegisterFiles.NUM_INT_REGISTERS = 32 [static]

Total number of integer registers.

3.4.4.3 Hashtable<String, String> RegisterFiles.registers_fp [private]

Consists of all floating point registers.

3.4.4.4 Hashtable<String, String> RegisterFiles.registers_int [private]

Consists of all integer registers.

The documentation for this class was generated from the following file:

- [RegisterFiles.java](#)
